# HAZUS-MH: Earthquake Event Report

Region Name:

Ash Creek Segment M69

Ash Creek Segment M6.9

Earthquake Scenario:

Print Date:

December 10, 2009

Totals only reflect data for those census tracts/blocks included in the user's study region.

#### Disclaimer:

The estimates of social and economic impacts contained in this report were produced using HAZUS loss estimation methodology software which is based on current scientific and engineering knowledge. There are uncertainties inherent in any loss estimation technique. Therefore, there may be significant differences between the modeled results contained in this report and the actual social and economic losses following a specific earthquake. These results can be improved by using enhanced inventory, geotechnical, and observed ground motion data.

Appendix A: County Listing for the Region Appendix B: Regional Population and Building Value Data

### General Description of the Region

HAZUS is a regional earthquake loss estimation model that was developed by the Federal Emergency Management Agency and the National Institute of Building Sciences. The primary purpose of HAZUS is to provide a methodology and software application to develop earthquake losses at a regional scale. These loss estimates would be used primarily by local, state and regional officials to plan and stimulate efforts to reduce risks from earthquakes and to prepare for emergency response and recovery.

The earthquake loss estimates provided in this report was based on a region that includes 8 county(ies) from the following state(s):

Utah

Note:

Appendix A contains a complete listing of the counties contained in the region.

The geographical size of the region is 22,771.95 square miles and contains 39 census tracts. There are over 63 thousand households in the region and has a total population of 192,276 people (2000 Census Bureau data). The distribution of population by State and County is provided in Appendix B.

There are an estimated 62 thousand buildings in the region with a total building replacement value (excluding contents) of 10,229 (millions of dollars). Approximately 97.00 % of the buildings (and 68.00% of the building value) are associated with residential housing.

The replacement value of the transportation and utility lifeline systems is estimated to be 13,287 and 1,079 (millions of dollars), respectively.

#### **Building Inventory**

HAZUS estimates that there are 62 thousand buildings in the region which have an aggregate total replacement value of 10,229 (millions of dollars). Appendix B provides a general distribution of the building value by State and County.

In terms of building construction types found in the region, wood frame construction makes up 70% of the building inventory. The remaining percentage is distributed between the other general building types.

#### Critical Facility Inventory

HAZUS breaks critical facilities into two (2) groups: essential facilities and high potential loss (HPL) facilities. Essential facilities include hospitals, medical clinics, schools, fire stations, police stations and emergency operations facilities. High potential loss facilities include dams, levees, military installations, nuclear power plants and hazardous material sites.

For essential facilities, there are 8 hospitals in the region with a total bed capacity of 537 beds. There are 112 schools, 82 fire stations, 19 police stations and 2 emergency operation facilities. With respect to HPL facilities, there are 124 dams identified within the region. Of these, 44 of the dams are classified as 'high hazard'. The inventory also includes 8 hazardous material sites, 0 military installations and 0 nuclear power plants.

#### Transportation and Utility Lifeline Inventory

Within HAZUS, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The lifeline inventory data are provided in Tables 1 and 2.

The total value of the lifeline inventory is over 14,366.00 (millions of dollars). This inventory includes over 2,523 kilometers of highways, 520 bridges, 58,288 kilometers of pipes.

System	Component	# locations/ # Segments	Replacement value (millions of dollars)

#### Table 2: Utility System Lifeline Inventory

### Earthquake Scenario

HAZUS uses the following set of information to define the earthquake parameters used for the earthquake loss estimate provided in this report.

Scenario Name	Ash Creek Segment M6.9
Type of Earthquake	User-defined
Fault Name	NA
Historical Epicenter ID #	NA
Probabilistic Return Period	NA
Longitude of Epicenter	NA
Latitude of Epicenter	NA
Earthquake Magnitude	6.90
Depth (Km)	NA
Rupture Length (Km)	NA
Rupture Orientation (degrees)	NA
Attenuation Function	NA

#### **Building Damage**

HAZUS estimates that about 1,235 buildings will be at least moderately damaged. This is over 2.00 % of the total number of buildings in the region. There are an estimated 10 buildings that will be damaged beyond repair. The definition of the 'damage states' is provided in Volume 1: Chapter 5 of the HAZUS technical manual. Table 3 below summaries the expected damage by general occupancy for the buildings in the region. Table 4 summaries the expected damage by general building type.

	None		Slight		Moderate		Extensive		Complete	
	Count	(%)	Count	(%)	Count	(%)	Count	(%)	Count	(%)
Agriculture	0	0.00	0	0.00	0	0.00	0	0.00	0	0.00

\*Note:

RM	Reinforced Masonry
URM	Unreinforced Masonry
MH	Manufactured Housing

### **Essential Facility Damage**

Before the earthquake, the region had 537 hospital beds available for use. On the day of the earthquake, the model estimates that only 461 hospital beds (86.00%) are available for use by patients already in the hospital and those injured by the earthquake. After one week, 97.00% of the beds will be back in service. By 30 days, 100.00% will be operational.

		# Facilities					
Classification	Total	At Least Moderate Damage > 50%	Complete Damage > 50%	With Functionality > 50% on day 1			
Hospitals	8	0	0	7			
Schools	112	0	0	112			
EOCs	2	0	0	2			
PoliceStations	19	0	0	19			
FireStations	82	0	0	78			

#### Transportation and Utility Lifeline Damage

Table 6 provides damage estimates for the transportation system.

				Number of Locatio	ns_		
System	Component	Locations/	With at Least	With Complete	With Functionality > 50 %		
		Segments	Mod. Damage	Damage	After Day 1	After Day 7

#### Table 6: Expected Damage to the Transportation Systems

Note: Roadway segments, railroad tracks and light rail tracks are assumed to be damaged by ground failure only. If ground failure maps are not provided, damage estimates to these components will not be computed.

Tables 7-9 provide information on the damage to the utility lifeline systems. Table 7 provides damage to the utility system facilities. Table 8 provides estimates on the number of leaks and breaks by the pipelines of the utility systems. For electric power and potable water, HAZUS performs a simplified system performance analysis. Table 9 provides a summary of the system performance information.

#### Table 7 : Expected Utility System Facility Damage

	# of Locations									
System	Total #	With at Least	With Complete	with Functionality > 50 %						
		Moderate Damage	Damage	After Day 1	After Day 7					
Potable Water	0	0	0	0	0					
Waste Water	5	0	0	5	5					
Natural Gas	0	0	0	0	C					
Oil Systems	2	0	0	2	2					
Electrical Power	5	0	0	5	5					
Communication	18	0	0	18	18					

#### Table 8 : Expected Utility System Pipeline Damage (Site Specific)

System	Total Pipelines Length (kms)	Number of Leaks	Number of Breaks
Potable Water	36,298	795	199
Waste Water	21,779	629	157
Natural Gas	211	0	0
Oil	0	0	0

#### Table 9: Expected Potable Water and Electric Power System Performance

	Total # of		Number of Ho	ouseholds witho	out Service		
	Households	At Day 1	At Day 3	At Day 7	At Day 30	At Day 90	
Potable Water	63,223	70	3	0	0	0	
Electric Power		0	0	0	0	0	

#### Fire Following Earthquake

Fires often occur after an earthquake. Because of the number of fires and the lack of water to fight the fires, they can often burn out of control. HAZUS uses a Monte Carlo simulation model to estimate the number of ignitions and the amount of burnt area. For this scenario, the model estimates that there will be 4 ignitions that will burn about 0.22 sq. mi 0.00 % of the region's total area.) The model also estimates that the fires will displace about 243 people and burn about 11 (millions of dollars) of building value.

#### **Debris Generation**

HAZUS estimates the amount of debris that will be generated by the earthquake. The model breaks the debris into two general categories: a) Brick/Wood and b) Reinforced Concrete/Steel. This distinction is made because of the different types of material handling equipment required to handle the debris.

The model estimates that a total of 0.060 million tons of debris will be generated. Of the total amount, Brick/Wood comprises 30.00% of the total, with the remainder being Reinforced Concrete/Steel. If the debris tonnage is converted to an estimated number of truckloads, it will require 2,360,000 truckloads (@25 tons/truck) to remove the debris generated by the earthquake.

#### Shelter Requirement

HAZUS estimates the number of households that are expected to be displaced from their homes due to the earthquake and the number of displaced people that will require accommodations in temporary public shelters. The model estimates 62 households to be displaced due to the earthquake. Of these, 51 people (out of a total population of 192,276) will seek temporary shelter in public shelters.

#### **Casualties**

HAZUS estimates the number of people that will be injured and killed by the earthquake. The casualties are broken down into four (4) severity levels that describe the extent of the injuries. The levels are described as follows;

- · Severity Level 1: Injuries will require medical attention but hospitalization is not needed.
- · Severity Level 2: Injuries will require hospitalization but are not considered life-threatening
- Severity Level 3: Injuries will require hospitalization and can become life threatening if not promptly treated.
- Severity Level 4: Victims are killed by the earthquake.

The casualty estimates are provided for three (3) times of day: 2:00 AM, 2:00 PM and 5:00 PM. These times represent the periods of the day that different sectors of the community are at their peak occupancy loads. The 2:00 AM estimate considers that the residential occupancy load is maximum, the 2:00 PM estimate considers that the educational, commercial and industrial sector loads are maximum and 5:00 PM represents peak commute time.

Table 10 provides a summary of the casualties estimated for this earthquake

		Level 1	Level 2	Level 3	Level 4
2 AM	Commercial	0	0	0	0
	Commuting	0	0	0	0
	Educational	0	0	0	0

Table 10: Casualty Estimates

#### Economic Loss

The total economic loss estimated for the earthquake is 156.24 (millions of dollars), which includes building and lifeline related losses based on the region's available inventory. The following three sections provide more detailed information about these losses.

#### **Building-Related Losses**

The building losses are broken into two categories: direct building losses and business interruption losses. The direct building losses are the estimated costs to repair or replace the damage caused to the building and its contents. The business interruption losses are the losses associated with inability to operate a business because of the damage sustained during the earthquake. Business interruption losses also include the temporary living expenses for those people displaced from their homes because of the earthquake.

The total building-related losses were 132.63 (millions of dollars); 29 % of the estimated losses were related to the business interruption of the region. By far, the largest loss was sustained by the residential occupancies which made up over 40 % of the total loss. Table 11 below provides a summary of the losses associated with the building damage.

_			(Millio	ns of dollars)			
Category	Area	Single Family	Other Residential	Commercial	Industrial	Others	Total
Income Los	es

	Total	33.80	18.79	45.14	10.53	24.38	132.63

Table 11: Building-Related Economic Loss Estimates

#### Transportation and Utility Lifeline Losses

For the transportation and utility lifeline systems, HAZUS computes the direct repair cost for each component only. There are no losses computed by HAZUS for business interruption due to lifeline outages. Tables 12 & 13 provide a detailed breakdown in the expected lifeline losses.

HAZUS estimates the long-term economic impacts to the region for 15 years after the earthquake. The model quantifies this information in terms of income and employment changes within the region. Table 14 presents the results of the region for the given earthquake.

System	Component	Inventory Value	Economic Loss	Loss Ratio (%)
